

Swing Carriage

Swing Carriages - The maximum load capacity for forklift jibs in both the retracted or extended positions range starting from 1935 lbs to as much as 6000 lbs. It is a good idea to ask a material handling specialist regarding the restrictions for your specific application. The load capacity ratings are really for the jib itself and not the lift truck or the maximum load that could be carried securely with a particular lift truck. It is essential to keep in mind that whenever whichever accessories like for instance a forklift jib are fitted to the lift truck, the new center of gravity made by the attachment will lessen the general lift capacity of the forklift. There are instructions obtainable which provide information on the way to properly determine these load limits.

Prior to using a forklift jib, ensure that it is properly secured to the lift truck with shackles and hooks. Always be sure in order to verify that the screw pins are tight. It is essential to also double check that the freight calculations have been made properly. Remember to take into account the fact that rated capacities at times decrease each time the boom is in a raised position, whenever the boom is extended with telehandlers or even each time the mast is slanted forward.

Vital pointers when making use of an adjustable jib is not to ever pull a load with this kind of attachment. These kinds of accessories are really only used for vertical lifting. In addition, avoid letting the load move backward and forward. Utilize extreme caution every time a load is carried in order to avoid tipping over the truck.
